*RNAV Standard Terminal Arrival Routes (STARs)*

and

Phoenix Sky Harbor International Airport, Phoenix Goodyear Airport,  
Glendale Municipal Airport, Phoenix Deer Valley Municipal Airport,  
Scottsdale Municipal Airport, Falcon Field, Phoenix Mesa Gateway Airport  
and Chandler Municipal Airport  
*IZZZO, MAYSA, LALUZ, FTHLS, SNOBL,*  
*MOHAK, YOTES, KATMN and BNYRD*  
*RNAV Standard Instrument Departures (SIDs)*

**Description of Action:**

The FAA is proposing the implementation of nine RNAV SIDs and five RNAV STARs into Phoenix Sky Harbor International Airport (PHX). Additionally, the DSERT STAR and all of the RNAV SIDs would service seven satellite airports in the greater Phoenix area. These seven satellite airports are: Phoenix Goodyear Airport (GYR), Glendale Municipal Airport (GEU), Phoenix Deer Valley Municipal Airport (DVT), Scottsdale Municipal Airport (SDL), Falcon Field (FFZ), Phoenix Mesa Gateway Airport (IWA) and Chandler Municipal Airport (CHD). Departures from these satellite airports would be vectored to the Initial Departure Fix on each of the proposed SIDs. In a Memo dated September 12<sup>th</sup> 2013, the FAA determined that the procedures as designed to date were categorically excluded from further environmental review as per the FAA Order 1050.1E, "Environmental Impacts: Policies and Procedures", FAA Modernization and Reform Act of 2012, Section 213 (c)(1) and Memo FAA Order 1050.1E, Change 1, Guidance Memo #5 dated December 6, 2012 "Guidance for Implementation of the Categorical Exclusion in Section 213(c)(1) of the FAA Modernization and Reform Act of 2012". Furthermore that the implementation of this action would not result in any extraordinary circumstances in accordance with FAA Order 1050.1E, "Environmental Impacts: Policies and Procedures".

**Investigation:**

The proposed STARS and SIDs for PHX and the satellite airports, as outlined in the September 2013 CATEX underwent multiple adjustments including name changes. Specifically the ZEPER SID was renamed to the MAYSA SID, the FORPE SID was renamed to the LALUZ SID, the SHRIF SID was renamed to the KATMN SID and the GBEND SID was renamed to the MOHAK SID. The FAA has redone the noise analysis for current version of the nine SIDS and five STARs. This noise analysis,

attached as Appendix A, indicates that the changes made to these nine SIDs and five STARS since the September 12<sup>th</sup> 2013 CATEX determination has not changed the noise impact determinations.

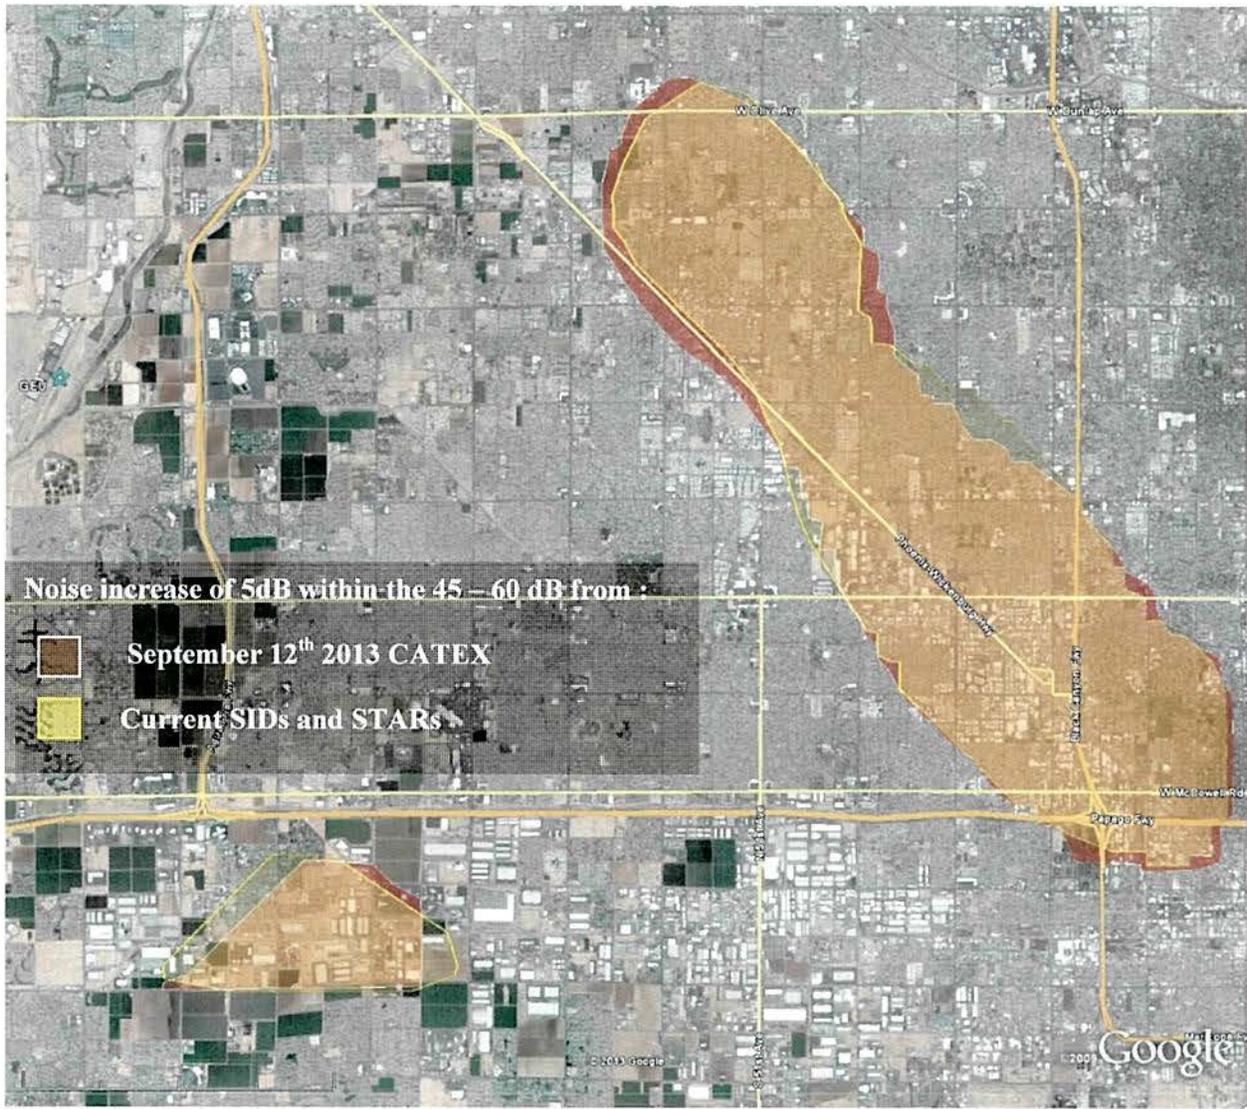

**Determination:**

Based on the updated noise analysis, the current versions of the proposed nine SIDs and five STARS at PHX and the seven satellite airports do not change the determinations to any of the impact categories as analyzed in the CATEX Determination, dated September 12<sup>th</sup> 2013. Therefore this CATEX determination is still valid.

This report was generated by the Federal Aviation Administration's Noise Screening Tool.

## Overview of NST

The FAA's Noise Integrated Routing System (NIRS) Screening Tool (NST) estimates the noise impact over a specific area due to proposed changes to an existing airspace design. NST computes its estimates by comparing the noise and fuel impacts for different scenarios, and presents its results in graphical and tabular formats.

A typical NST study compares noise associated with a baseline route and an alternative route. The baseline route is the route aircraft currently fly into and out of an airport; an alternative route is a proposed change to that route. The alternative route may be higher or lower than the baseline route; it may operate a different times of day, or incorporate a different aircraft mix. The alternative route has a noise impact different from the baseline route.

NST takes into account many factors when evaluating noise impact. These factors include the time of day, land use, type of aircraft, route geometry, and operation. For example, the impact of a heavy jet flying over a quiet suburb in the late evening is different from a private aircraft flying over a dense metropolitan area during mid-day.

For more information about NST, see [Noise Integrated Routing System \(NIRS\) & NIRS Screening Tool \(NST\)](http://www.faa.gov/about/office_org/headquarters_offices/apl/research/models/nirs_nst/) at the FAA web site ([http://www.faa.gov/about/office\\_org/headquarters\\_offices/apl/research/models/nirs\\_nst/](http://www.faa.gov/about/office_org/headquarters_offices/apl/research/models/nirs_nst/)).

## Overview of Day Night Levels

This report estimates noise impact in terms of Day-Night Average Sound Level (DNL). DNL, expressed in decibels (dB), is a 24-hour average noise level used to define the level of noise exposure on a community. The DNL represents the average sound exposure during a 24-hour period and does not represent the sound level for a specific noise event. A 10 dB correction is applied to nighttime (10:00 p.m. and 7:00 a.m.) sound levels to account for increased annoyance due to noise during the night hours. There are many other metrics that can be used to describe aircraft noise levels; however DNL has been most widely accepted as the preferred metric for determining noise level exposure at airports.

## Fuel Burn

The amount of fuel burn between the alternative and baseline routes decreased by 12.02%

Scenario	Fuel Burn (lbs)
Baseline	141,991.188
Alternative	124,924.758

## Flight Performance

This section describes the overall flight performance results for the study.

### Baseline Scenario

- 213 out of 221 (96.4%) route(s) had all flights successfully modeled.
- 27,266 out of 27,281 (99.9%) event(s) were successfully modeled.
- 3,108.804 out of 3,109.385 (100%) weighted operations(s) were successfully modeled.
  - 341.387 out of 341.748 (99.9%) day operations(s) were successfully modeled.
  - 276.742 out of 276.764 (100%) night operations(s) were successfully modeled.

### Alternative Scenario

- 166 out of 180 (92.2%) route(s) had all flights successfully modeled.
- 25,304 out of 25,327 (99.9%) event(s) were successfully modeled.
- 2,892.922 out of 2,893.687 (100%) weighted operations(s) were successfully modeled.
  - 331.069 out of 331.614 (99.8%) day operations(s) were successfully modeled.
  - 256.185 out of 256.207 (100%) night operations(s) were successfully modeled.
